

S.No: 1	Exp. Name: <b><i>Write a python script to display a simple message.</i></b>	Date: 2024-02-26
---------	---	------------------

**Aim:**

Write a python script to display a simple message.

**Source Code:**

```
sample_messag.py
```

```
print("Welcome to Python Programming Lab")
```

### Execution Results - All test cases have succeeded!

Test Case - 1
<b>User Output</b>
Welcome to Python Programming Lab

**S.No: 2**

Exp. Name: ***Write a python script to perform basic arithmetic operations on two values which are accepted from the user***

**Date: 2024-03-02**

**Aim:**

Write a python script to perform basic arithmetic operations on two values which are accepted from the user

**Source Code:**

operation.py

```
num1 = input('Enter a number1: ')
num2 = input('Enter a number2: ')
sum = int(num1) + int(num2)
min = int(num1) - int(num2)
Mul = int(num1) * int(num2)
div = float(num1) / float(num2)
mod = int(num1) % int(num2)
fd = int(num1) // int(num2)
ex = int(num1) ** int(num2)
print('Addition of {0} and {1} is {2}'.format(num1,num2,sum))
print('Subtraction of {0} from {1} is {2}'.format(num1,num2,min))
print('Multiplication of {0} with {1} is {2}'.format(num1,num2,Mul))
print('Division of {0} by {1} is {2}'.format(num1,num2,div))
print('Modulus of {0} by {1} is {2}'.format(num1,num2,mod))
print('Floor Division of {0} by {1} is {2}'.format(num1,num2,fd))
print('Exponent of {0} to the power of {1} is {2}'.format(num1,num2,ex))
```

**Execution Results - All test cases have succeeded!**

Test Case - 1	
<b>User Output</b>	
Enter a number1:	
8	
Enter a number2:	
4	
Addition of 8 and 4 is 12	
Subtraction of 8 from 4 is 4	
Multiplication of 8 with 4 is 32	
Division of 8 by 4 is 2.0	
Modulus of 8 by 4 is 0	
Floor Division of 8 by 4 is 2	
Exponent of 8 to the power of 4 is 4096	

S.No: 3	Exp. Name: <b><i>Write a python script to calculate the factorial of a given number.</i></b>	Date: 2024-03-10
---------	--	------------------

**Aim:**

Write a python script to calculate the factorial of a given number.

**Source Code:**

factorial.py

```
n=int(input("Enter a number :"))
fact=1
for i in range(1,n+1):
    fact=fact*i
print("Factorial of",n,"is",fact)
```

**Execution Results - All test cases have succeeded!**

Test Case - 1	
<b>User Output</b>	
Enter a number :	
5	
Factorial of 5 is 120	

S.No: 4

Exp. Name: **Write a python script to calculate sum of individual digits of a given number**

Date: 2024-03-10

**Aim:**

Write a python script to calculate sum of individual digits of a given number

**Source Code:**

sumofindi.py

```
num=input("Sum of individual difits of a given number \nEnter a number :")  
sum=0  
for i in num:  
    sum=sum+int(i)  
print("The sum of", num , "is :",sum)
```

**Execution Results** - All test cases have succeeded!

**Test Case - 1**

**User Output**

Sum of individual difits of a given number

Enter a number :

5234

The sum of 5234 is : 14

S.No: 5	Exp. Name: <b><i>Write a python script to display the prime number series up to the given N Value</i></b>	Date: 2024-03-10
---------	---	------------------

**S.No: 16**

Exp. Name: **Write a program to find a given element, if the element to be found and its next element are the same then return True as output, otherwise return False.**

**Date: 2024-05-15**

**Aim:**

Write a program to find the given element in a list. If the element to be found and its next element are the same, then return **True**, otherwise return **False**.

**Sample Input and Output - 1:**

```
list1: 32,36,36,5  
num: 36  
True
```

**Sample Input and Output - 2:**

```
list1: 33,34,35  
num: 34  
False
```

**Source Code:**

List15.py

```
#write your code here  
data=input("data: ")  
list=data.split(",")  
size=len(list)  
for i in range(size):  
    list[i]=int(list[i])  
print("list:",list)  
find=int(input("num: "))  
for i in range(0,len(list)-1):  
    if list[i]==find:  
        if list[i+1]==find:  
            result="True"  
            break  
        else:  
            result="False"  
print(result)
```

**Execution Results - All test cases have succeeded!**

**Test Case - 1**

**User Output**

```
data:  
10,20,30  
list: [10, 20, 30]  
num:
```

20

False

### Test Case - 2

#### User Output

data:

10,20,20,30

list: [10, 20, 20, 30]

num:

20

True

**S.No: 17**

Exp. Name: **Write a python script to arrange the given list of elements in ascending or descending order.**

**Date: 2024-05-14**

**Aim:**

Write a python script to arrange the given list of elements in ascending or descending order.

**Source Code:**

order.py

```
num=list(map(int,input("Enter list of numbers: ").split()))
num.sort()
print(num)
num.sort(reverse=True)
print(num)
```

## Execution Results - All test cases have succeeded!

### Test Case - 1

#### User Output

Enter list of numbers:

2 5 8 96 3 1 4 7

[1, 2, 3, 4, 5, 7, 8, 96]

[96, 8, 7, 5, 4, 3, 2, 1]

### Test Case - 2

#### User Output

Enter list of numbers:

25 63 47 85 41 69

[25, 41, 47, 63, 69, 85]

[85, 69, 63, 47, 41, 25]

S.No: 18

Exp. Name: **Write a Python program to find gcd of two numbers**

Date: 2024-05-14

**Aim:**

Write a Python program to find the GCD of two numbers.

**Source Code:**

gcdOfTwoNumbers.py

```
import math
def gcd_two(a,b):
    print("The gcd of two numbers is:",math.gcd(a,b))
a=int(input("Enter first number: "))
b=int(input("Enter second number: "))
gcd_two(a,b)
```

**Execution Results - All test cases have succeeded!**

**Test Case - 1**

**User Output**

Enter first number:

10

Enter second number:

20

The gcd of two numbers is: 10

**Test Case - 2**

**User Output**

Enter first number:

78

Enter second number:

9

The gcd of two numbers is: 3

S.No: 19

Exp. Name: **Write a python script to find GCD of two numbers using recursive**

Date: 2024-05-14

**Aim:**

Write a python script to find GCD of two numbers using recursive.

**Source Code:**

gcd.py

```
def gcd(a,b):
    if(b==0):
        return a
    else:
        return gcd(b,a%b)
a=int(input("Enter first number:"))
b=int(input("Enter second number:"))
GCD=gcd(a,b)
print("GCD is: ",GCD)
```

**Execution Results - All test cases have succeeded!**

**Test Case - 1**

**User Output**

Enter first number:

12

Enter second number:

6

GCD is: 6

S.No: 20	Exp. Name: <b><i>Write a Python program to convert temperatures to and from Celsius, Fahrenheit.</i></b>	Date: 2024-05-14
----------	--	------------------

**Aim:**

Write a Python program to convert temperatures to and from Celsius, Fahrenheit.

**Source Code:**

temperature.py

```
a=input("Enter the temperature in celsius or fahrenheit: ")
b=int(a[:-1])
c=a[-1]
if(c=="C" or c=="c"):
    result=int(round((9*b)/5+32))
    d="Fahrenheit"
elif(c=="F" or c=="f"):
    result=int(round((b-32)*5/9))
    d="Celsius"
else:
    print("Enter the proper convention")
    quit()
print("The temperature in",d,"is",result,"degrees")
```

### Execution Results - All test cases have succeeded!

#### Test Case - 1

##### User Output

Enter the temperature in celsius or fahrenheit:

215c

The temperature in Fahrenheit is 419 degrees

#### Test Case - 2

##### User Output

Enter the temperature in celsius or fahrenheit:

105F

The temperature in Celsius is 41 degrees
